EDUCATION

Honours BsC Computer Science - Information Systems Specialist

Sep 2024 - Jun 2028

University of Toronto, Scarborough Campus

4th Year Student (15.0/20.0 credits completed)

TECHNICAL SKILLS

Languages: Python, JavaScript, Java, SQL, C, TypeScript

Frontend: React, Mantine UI, HTML5/CSS3

Backend: Node.js, FastAPI, Firebase (NoSQL), Supabase, PostgreSQL, SQLite, RESTful APIs (Axios), Gemini API.

AI & Data Analysis: LangChain, LangGraph (Agentic AI), Pandas, NumPy, Scikit-learn, Matplotlib.

Systems & Infrastructure: Unix/Linux, Shell Scripting, Socket Programming (TCP/IP), Epoll, SSH, Git, Docker.

Specialized Tools: Figma (UI/UX), GIS (ArcGIS, QGIS), MS Excel/Access.

PROJECTS

Beacon | Hackathon Project - GenAI Genesis 2026

Mar 2026

- Engineered an AI advisor using LangGraph and LLMs to generate long-term survival roadmaps and optimize resource navigation for individuals in crisis.
- Implemented agentic logic (TAA flow) for dynamic roadmap generation, adapting to real-time situations via the Brave Search API.

MovieMind | Personal Project

Feb 2026

- Leveraged Python's Pandas to execute a 99.4% reduction of a 435k-movie dataset, filtering out low-engagement records to minimize metadata noise for TF-IDF vectorization using Scikit-learn and NumPy.
- Deployed a production-ready FastAPI backend to perform content-based recommendations using Cosine Similarity in real-time, utilizing asynchronous communication via Axios for low-latency user experiences.

Smart-Air | Coursework - Software Design

Dec 2025

- Built and deployed a native Android asthma tracker, collaborating within an Agile SDLC (Scrum/Jira) from concept to deployment.
- Engineered a Java-based emergency triage feature, leveraging Firebase Realtime Database (NoSQL) to ensure data scalability and real-time logging for high-concurrency health environments.

Noted | Personal Project

Sep 2025

- Developed a secure, CRUD-compliant notes application using SQLCipher for user-keyed database encryption.
- Utilized Python's Tkinter (with ttkbootstrap) to build a modern, intuitive GUI for efficient memo storage and retrieval.

Battleship Server | Coursework - Software Tools and System Programming

Aug 2025

- Created a multi-client server in C utilizing low-level I/O methods and network sockets, enabling users to connect via designated ports and interact through command-line inputs.
- Implemented I/O multiplexing by using epoll to manage concurrent users, allowing for real-time feedback from the server with error handling on writes, reads and disconnects.

EXPERIENCE

Retail Payments Intern

Scotiabank

Sept 2026 - Present

- Standardized weekly data aggregation workflows by reconciling disparate transactional feeds into unified master data models, eliminating structural discrepancies across reporting cycles.
- Synthesized key performance indicators, including card transaction volumes and penetration rates, into quantitative data visualizations to support executive product decisions.
